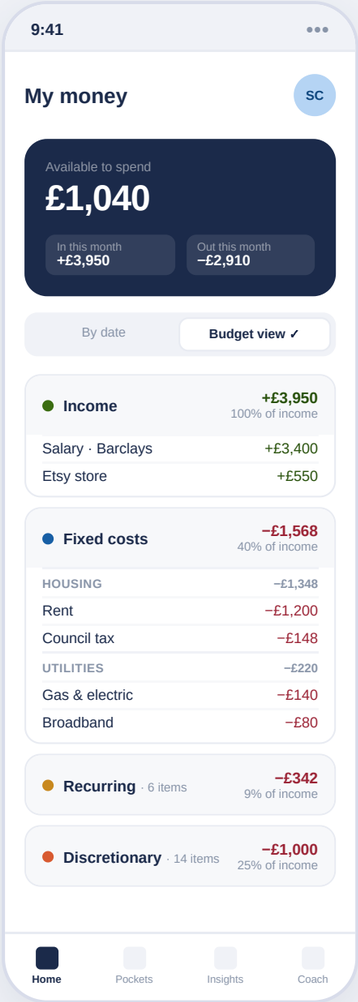
DAY 0

Structured budget view

The wake-up — replace the Excel

BUDGET VIEW



What this screen does

Toggle between views

Customers switch between the default chronological list and this structured budget view — no setup required. The active state is clearly labelled.

Accordion structure

Headers show total + % of income at a glance. Customers tap to expand subcategories — mirrors the Excel they already build manually.

Multiple income sources

Salary and side income (Etsy) shown separately under Income — important for the mass affluent segment where blended income is common.

Available to spend as hero number

Shows what is left, not total balance — immediately answers the question customers actually have when they open the app.

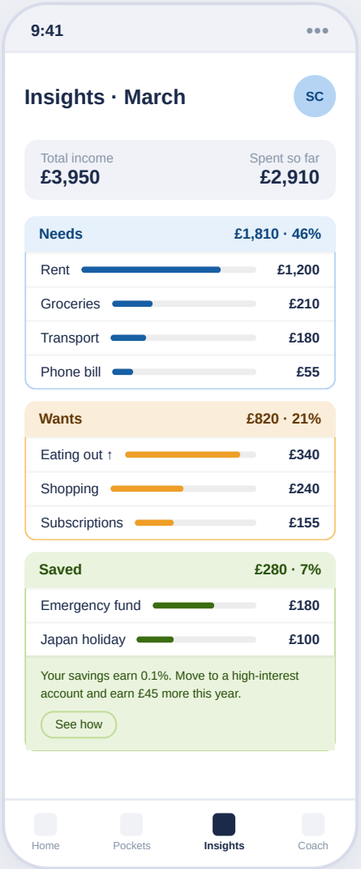
⚠ Assumption to test: Customers will trust the bank's auto-categorisation from day 1. Miscategorisation at this stage destroys trust immediately — accuracy is non-negotiable before launch.

WEEK 1

Spending insights

First look — needs, wants, saved

INSIGHTS SCREEN



What this screen does

Total income anchors everything

Shown at the top so all percentages are relative to actual income — not spending alone. Customers understand proportion, not just amount.

Needs / Wants / Saved — not 50/30/20

Framework used as internal logic but not labelled as 50/30/20 to the customer. Avoids shaming people for whom the ratios don't apply — interview data confirmed one participant had never heard of it.

Saved replaces Growth at this stage

"Saved" is honest — "Growth" implies something the customer hasn't done yet. The HISA nudge sits naturally inside Saved, making the upsell feel earned rather than pushed.

Inline ↑ flag for overspend

Eating out flagged with ↑ in context — no separate notification needed at this stage. Keeps insight where the customer is already looking.

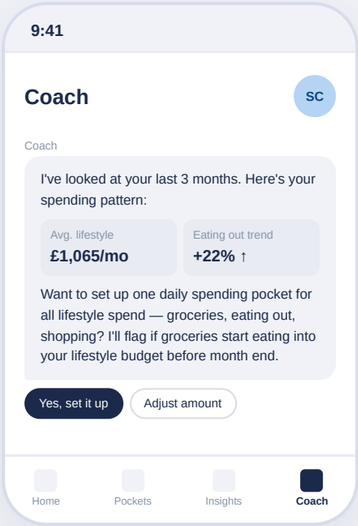
⚠ Assumption to test: Framework must flex for high-cost city earners where fixed costs alone exceed 50%. Design must never make a customer feel like they are failing a system built for someone else.

MONTH 1 · FLOW A

Behaviour review → spending pocket → virtual card

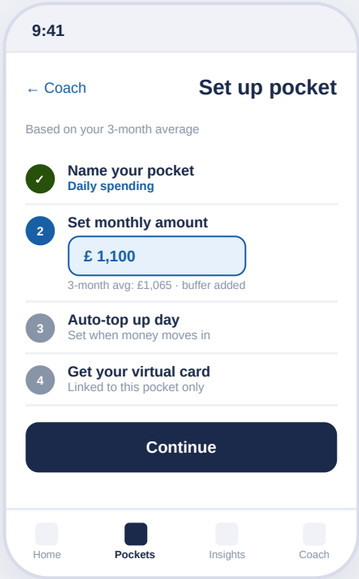
Coach surfaces patterns → customer confirms → pocket created with virtual card in 3 steps

1 · COACH INSIGHT



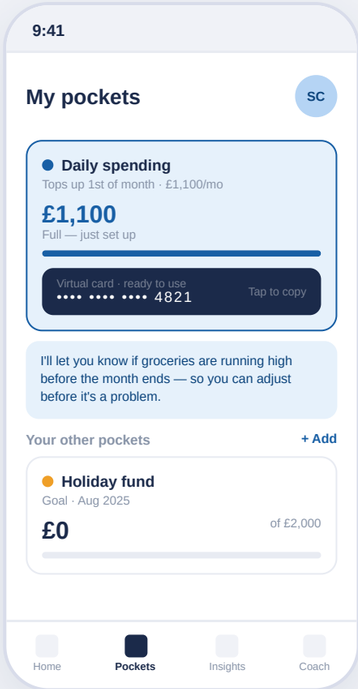
→

2 · POCKET SETUP



→

3 · POCKET LIVE + VIRTUAL CARD



Flow A · decisions

One pocket for all liquid lifestyle spend

Groceries and wants combined — customer sees one number, not a management overhead. The distinction between grocery and discretionary is handled through monitoring, not account structure.

4-step setup, pre-filled from history

Amount is pre-calculated with a buffer. Customer confirms rather than inputs — reduces cognitive load at the point where most setups fail.

Virtual card appears on confirmation

Immediately usable — no wait time. The card is the tangible proof that the system is running. This is the moment that makes the pocket feel real rather than abstract.

⚠ Assumption to test: Pocket setup must feel effortless. Any friction at this stage kills adoption. Also: pre-filled amount must feel intelligent — a generic suggestion erodes trust immediately.

MONTH 1 · FLOW B

Holiday goal → savings plan → post-holiday recovery

Goal created with auto-transfer · wants reduction · full recovery plan shown upfront

1 · HOLIDAY GOAL

9:41

Coach SC

I want to go to Japan — I need £2,000 by August

Coach

August is 5 months away. You need £400/mo. Here's how I'd split that:

Reduce wants by	From savings
£200/mo	**£200/mo**

After August, if you keep the reduced wants pattern going, you'll recoup the £1,000 from savings by December — and end the year with more saved than you started.

2 · GOAL CREATION

9:41

← Coach **Create goal**

Goal name: **Japan holiday**

Target amount: **£ 2,000**

Target date: **August 2025**

Monthly transfer: **£ 400 / month**

After August

Wants allowance returns to normal. £200/mo saving continues → savings recouped by Dec 2025.

Confirm goal + auto-transfer

3 · GOAL LIVE + RECOVERY PLAN

9:41

Japan holiday ← Pockets

Japan holiday
£400/mo · target Aug 2025
£0 of £2,000 · 0 months in

Your year-round plan

- Mar — **Now → Aug: save £400/mo** — £200 from wants · £200 from savings
- Aug — **Holiday — enjoy it** — Goal complete · £2,000 reached
- Sep — **Wants return to normal** — Keep saving £200/mo → recoup by Dec
- Dec — **Savings restored** — End year ahead of where you started

Home · Pockets · Insights · Coach

Flow B · decisions

Recovery plan shown at goal creation
Not revealed as a surprise after the holiday. If the customer can see the whole arc upfront, the sacrifice feels temporary rather than open-ended.

"End year ahead of where you started"
Load-bearing line — reframes the goal from spending money to a net gain in savings. Changes the emotional register from guilt to optimism.

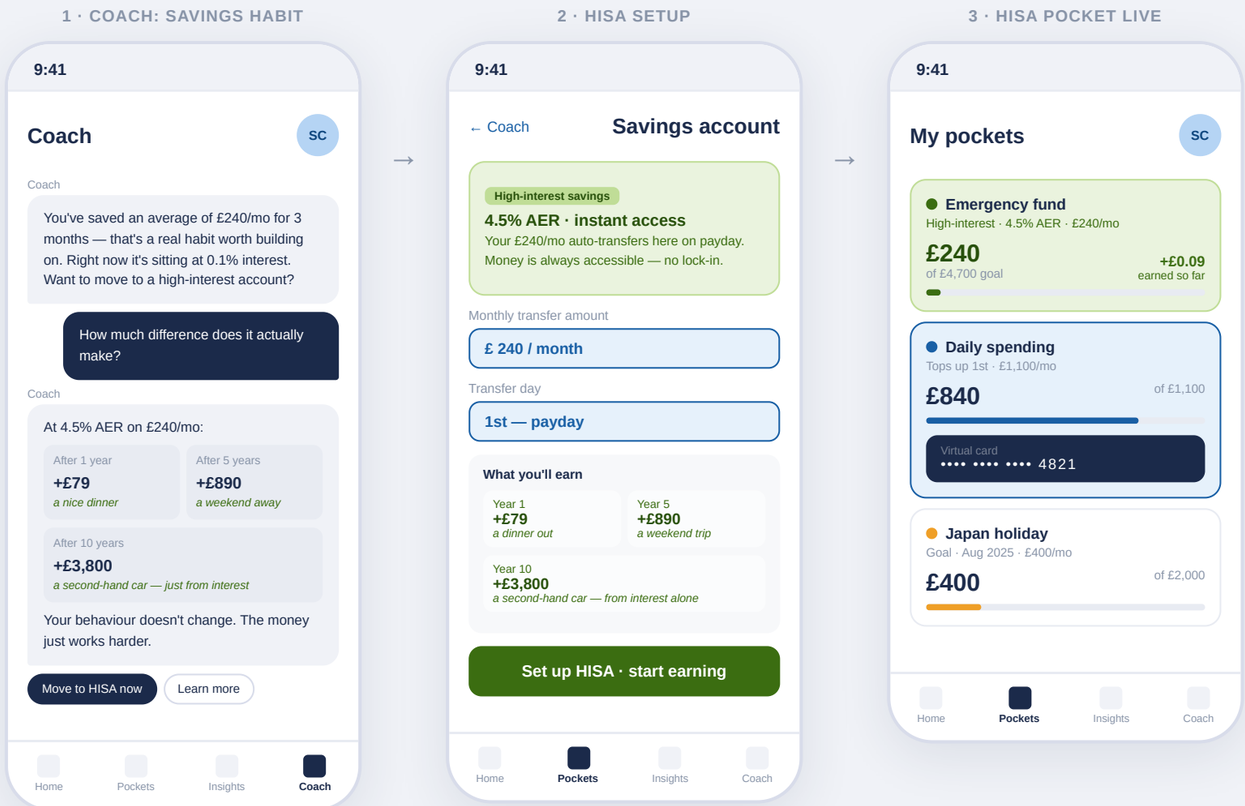
Auto-revert managed by coach
Wants return to normal automatically after August. Customer doesn't have to remember or act — the system does it. Trust-building through reliability, not just advice.

⚠ Assumption to test: Does showing the post-holiday plan at goal creation feel reassuring, or does it feel like the bank is already planning how to recoup the money? Framing matters here.

MONTH 1 · FLOW C

Savings habit → move to HISA → projected value over time

Coach identifies consistent savers · HISA framed as "free money" · projections in real-world terms



Flow C · decisions

Projections in real-world terms

Dinner → weekend away → second-hand car. Year 1 is small enough not to feel intimidating. Year 10 is concrete enough to make compounding feel real rather than abstract. "From interest alone" is the key phrase — reframes savings as generating something, not just storing it.

Interest earned from day one

Even £0.09 is shown. This is intentional — it makes compounding tangible from the first day rather than theoretical. Behavioural research shows early visible reward increases habit persistence.

Transfer set to payday

Pay-yourself-first framing. Money moves before it reaches the spending account. Interview data confirmed this is the single highest-impact behaviour change for this customer group.

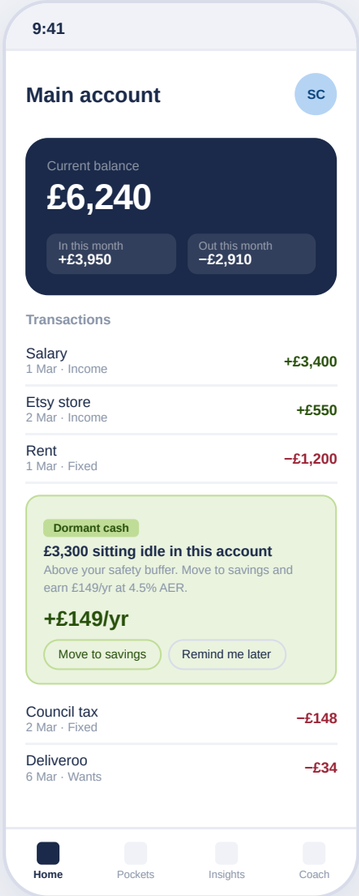
⚠ Assumption to test: Does "second-hand car" land as the right anchor for this customer segment? At £45–100k income, a second-hand car may feel modest. Worth testing whether a different Year 10 anchor (holiday, home deposit contribution) resonates better.

YEAR 1–3

Contextual growth nudges

Placed where the customer is already looking — not in a separate tab

ACCOUNT SCREEN · DORMANT CASH BANNER



INSIGHTS SCREEN · INVESTING NUDGE

Placement principle

Dormant cash in account screen
Customer sees a high balance — nudge is right there. Specificity is the hook: £3,300 + £149/yr, not a generic rate pitch.

Investing nudge in insights
Appears at the bottom of Saved once goal progress is visible. Earned placement — not a cold push.

Talk to coach as second option
Lower-commitment path if not ready to act. Reduces drop-off without removing the primary CTA.

Never in a standalone Grow tab
Contextual beats navigational. Growth nudges need to find customers where they already are.
